The inadequacy of the resting ECG 'falsely re-assuring'

150 patients presenting with Angina

66 had normal resting ECG

37/66 at angiography had severe CAD

Bayes Theorem

Rev Thomas Bayes
1702 - 1760

Bayes' theorem

A theory of probability

‘The post test probability is proportional to the pretest probability’

Bayes' theorem

A theory of probability

‘The post test probability is proportional to the pretest probability’

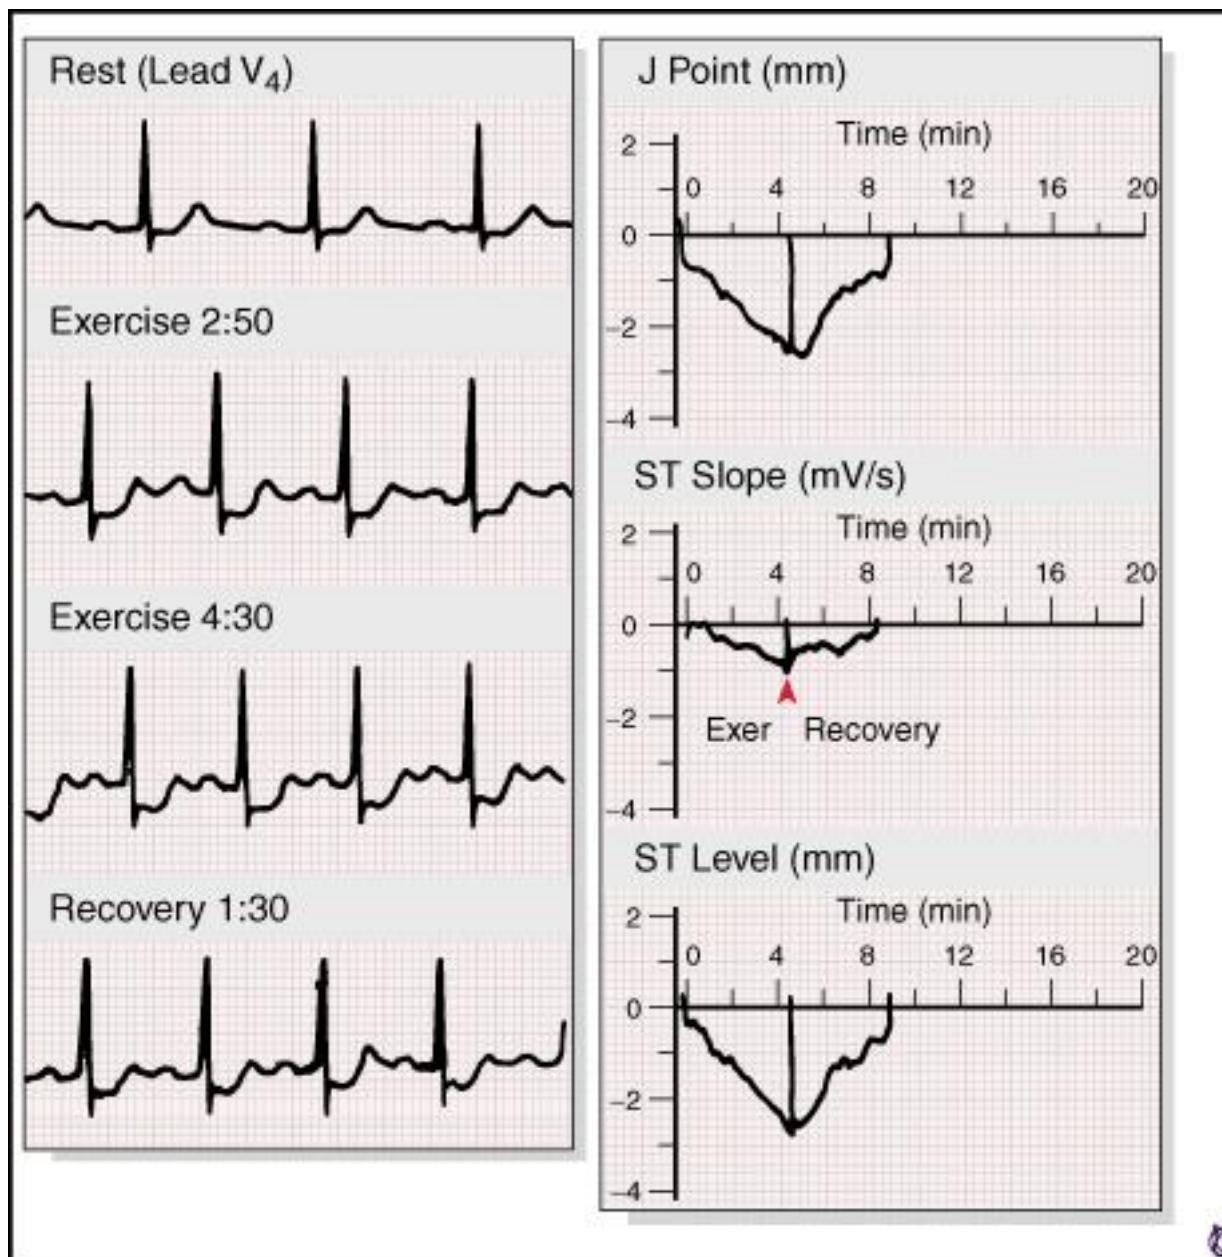

Some-one tested positive for a disease;
the probability that they actually have the disease
depends,
not only on the accuracy and sensitivity of the test,
but on their background (prior) probability of the disease.

ETT Bicycle or treadmill?

The Exercise ECG

1 = Iso-electric
2 = J point
3 = J + 80 msec

25,927 apparently healthy asymptomatic men 20 to 82 years of age

Importance of Functional Capacity as a predictor of mortality

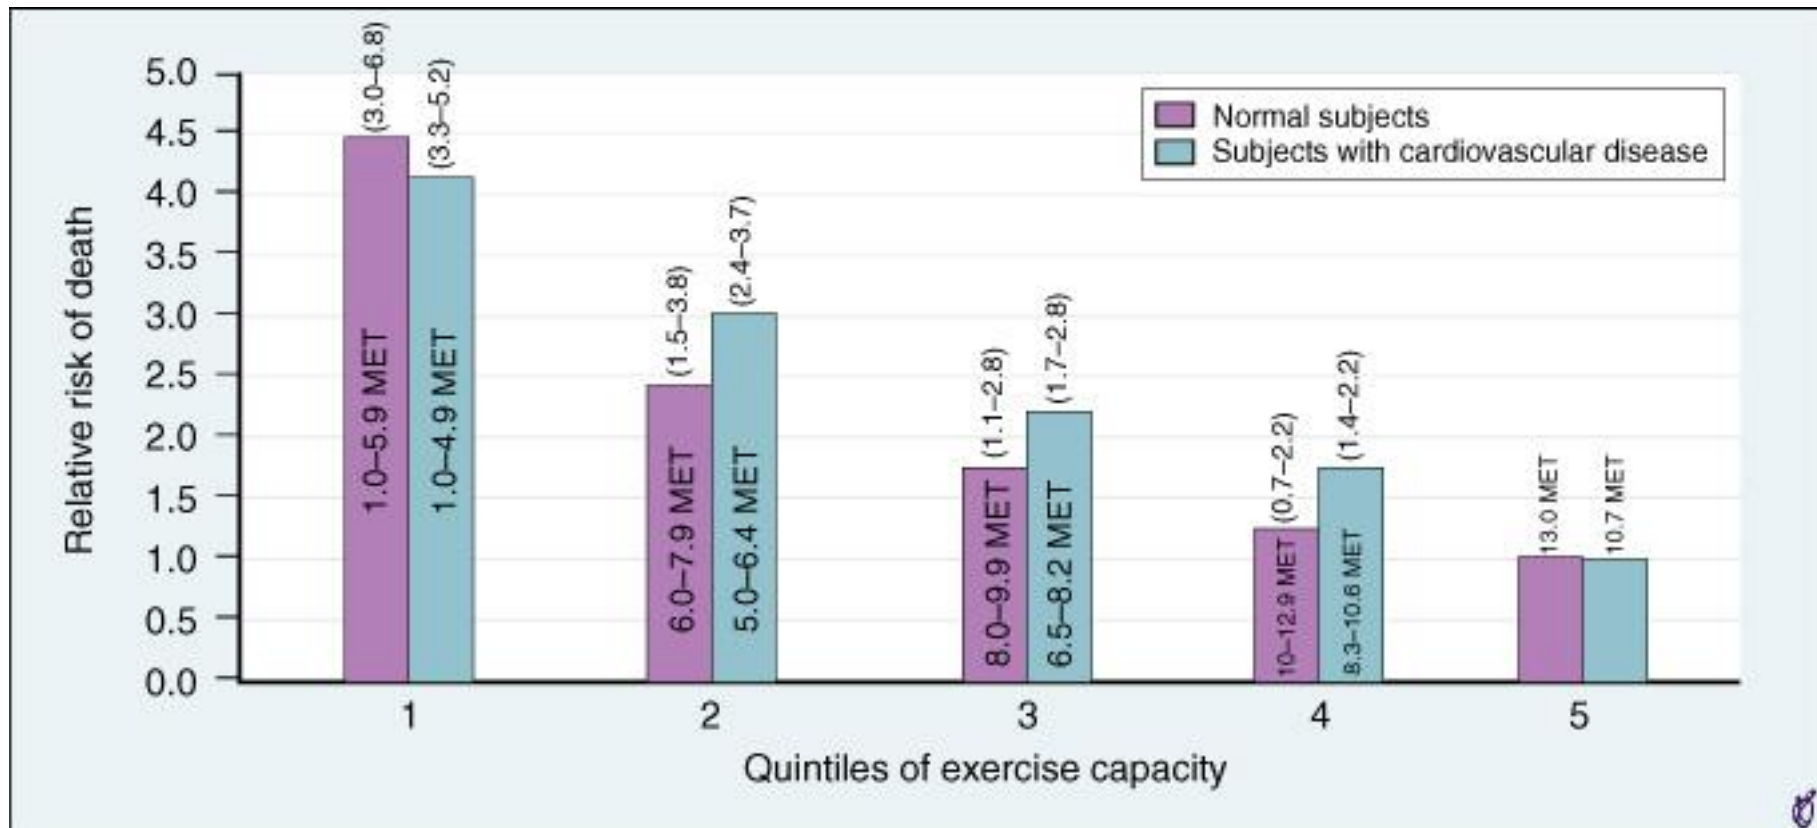

In low risk individuals
the functional capacity is an overwhelmingly
important predictor of mortality (RR 3.96)
compared to Thallium perfusion defect

Snader JACC 1997.

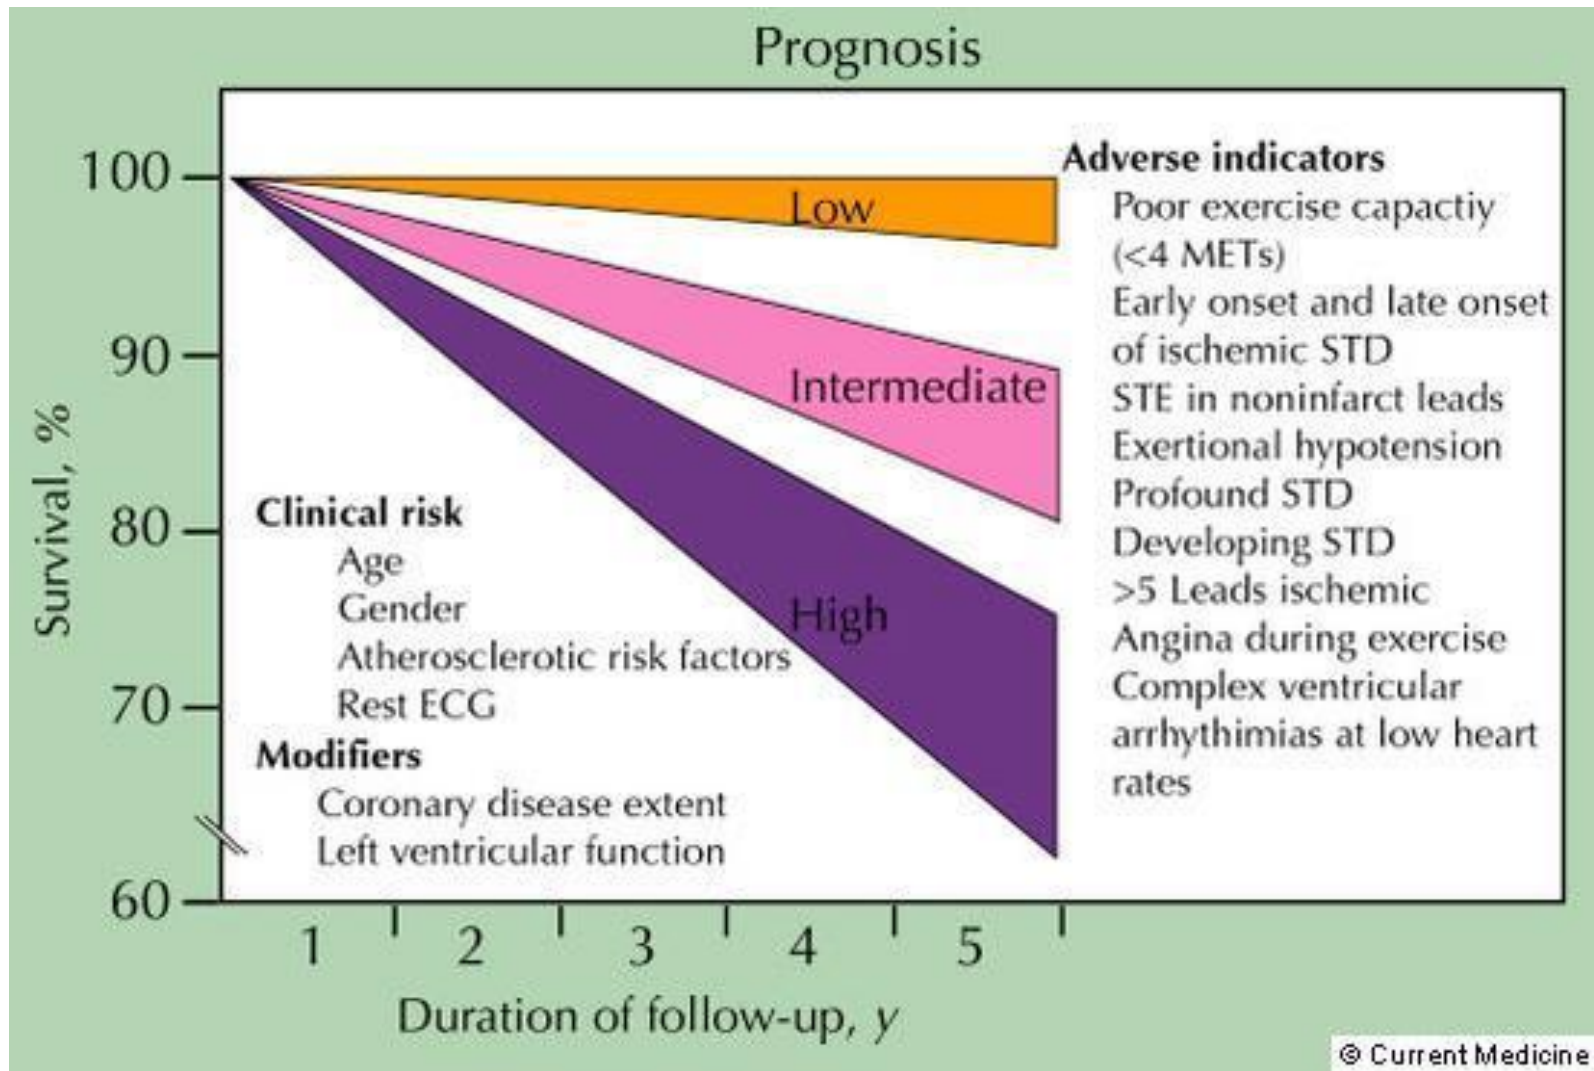

Copyright © 2005 by Elsevier Inc.

Relative risk of death among subjects with various risk factors
Is related to achieved exercise workloads.

For each 1-MET increase in exercise capacity, the survival improved by 12 percent
N Engl J Med 2002

Survival curves: patients with normal/mildly impaired LV function

Prognostic assessment using Duke treadmill score

Treadmill vs Bicycle

Treadmill **exercise testing** has several advantages over cycle ergometry

- for most people, treadmill walking is a more familiar activity than cycling.
- it involves a larger muscle mass and
- more work against gravity.
- consequently, Oxygen consumption is, on average, 5–10% higher on the treadmill than on a cycle ergometer

Why use a Treadmill vs Bicycle

- Exercise capacity v.important predictor
 - 1 min on Bruce = 8% decrease in mortality
- Strongest predictor of mortality is exercise capacity
- Survey of VA Hospitals >82% use Bruce
- Patients achieve a higher workload on a Treadmill vs Bicycle

Blair JAM 1995

Snader JACC 1997

Myers JCP Rehab 200

Hambrecht RP, Schuler GC, Muth T, et al.

**Greater diagnostic
sensitivity of treadmill versus cycle exercise
testing of asymptomatic men with coronary
artery disease.**

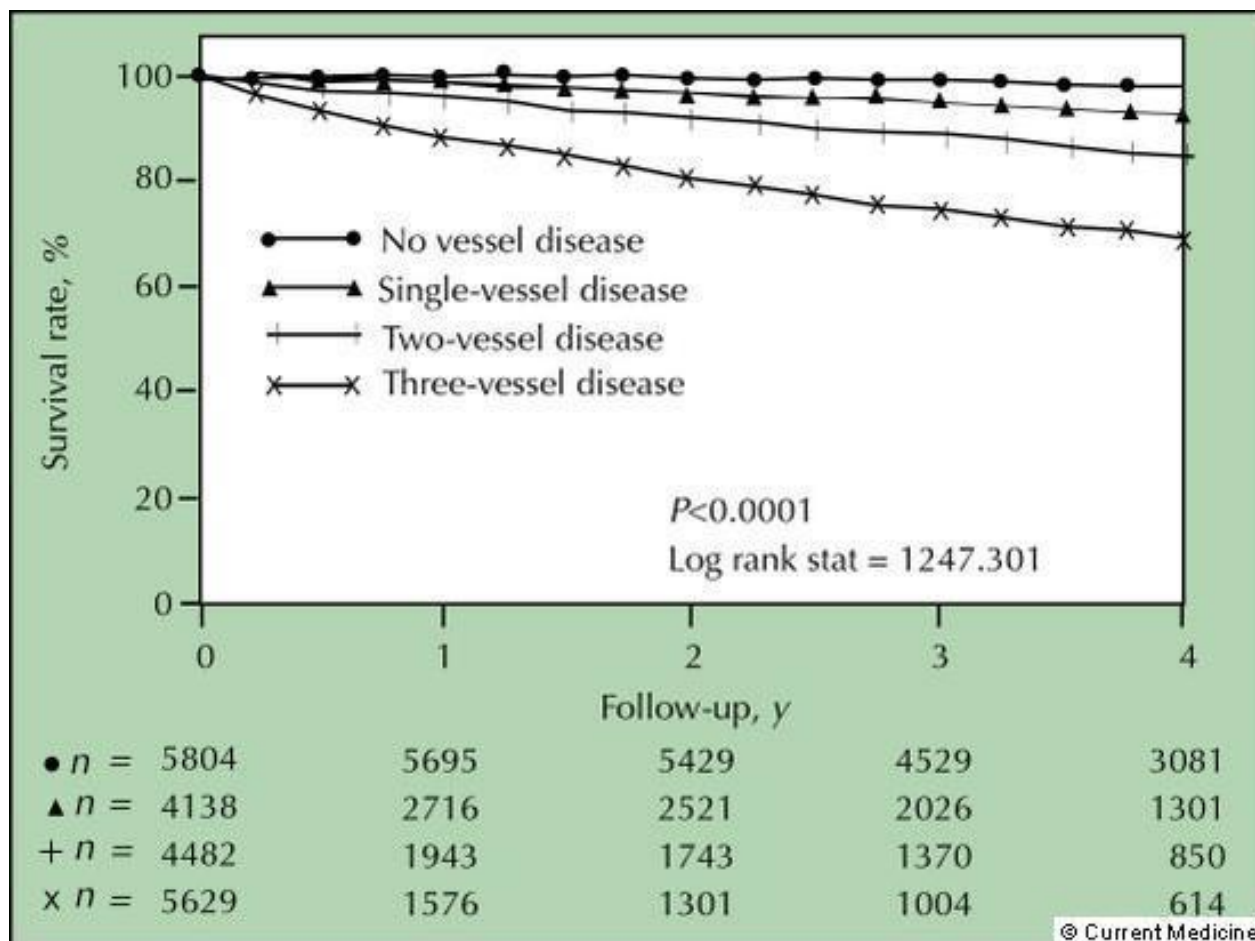

Am J Cardiol 1992;
70: 141–46.

Bicycle vs Treadmill

Given two tests in the same patient, the one capable of eliciting a higher level of exercise represents a truer examination of cardiopulmonary function (rather than the limitations of local muscle fatigue).

Coronary Artery Disease

Cumulative 4-year survival of medically treated CAD patients

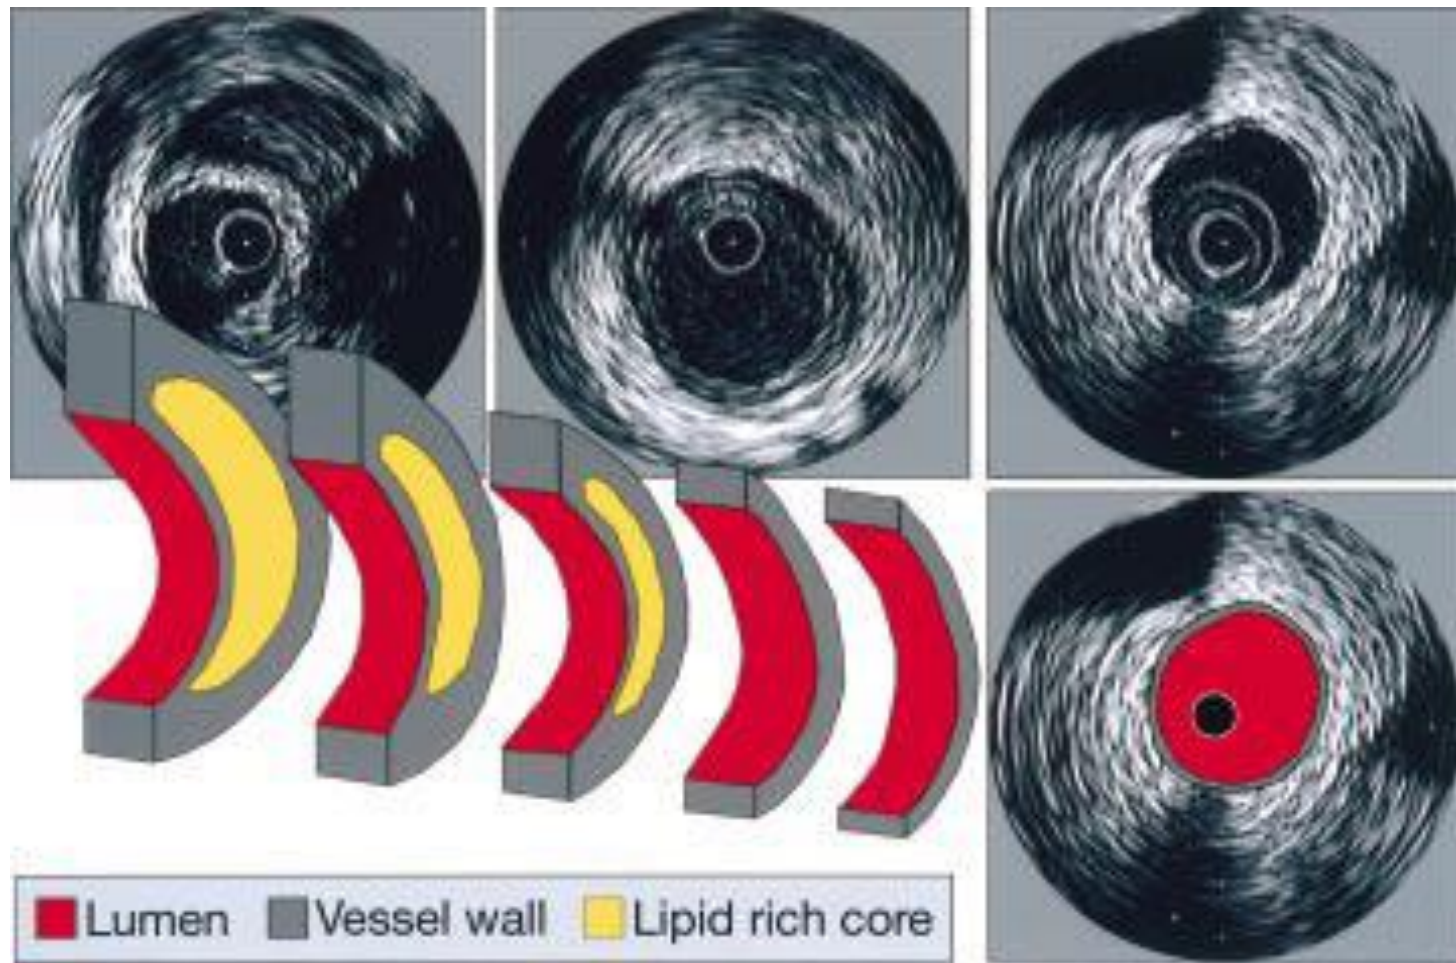

Atheroma morphology by intravascular ultrasound

Mixed

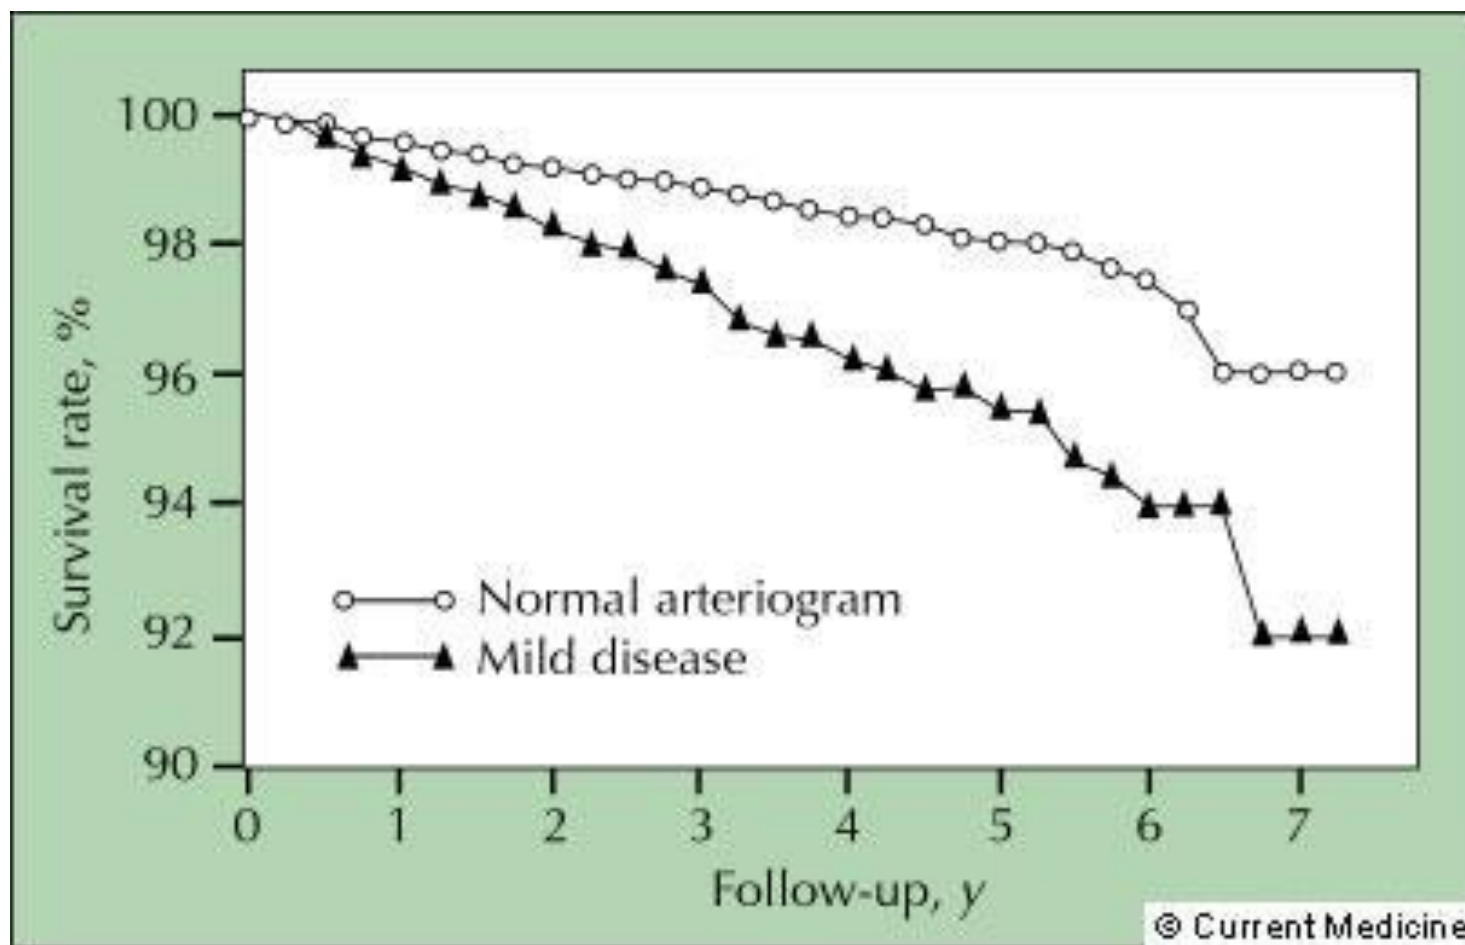

Calcified

The developing atheroma spares the lumen.
When the lumen is affected, the atheroma is well advanced.

Survival: normal coronary arteriograms vs. 'mild' disease

Plaque-fissure and intracoronary thrombus

Minor coronary lesions may thrombose and result in subsequent MI

- New Risk Factors
 - Coronary calcium scores

As plaque ages, calcium is laid down
EBCT sensitivity 80 to 90%, specificity 60% for plaque

EBCT uses a rotating electron beam and a stationary tungsten target

MSCT scanners employ an x ray beam and multiple detectors

Coronary artery calcification scores

Estimated Annual Risk of Death or MI with increasing calcium scores in patients at intermediate risk of coronary heart disease

In patients with an intermediate risk with a CAC score ≥ 400 :

the patient's 10-year CHD risk is equivalent to that noted with diabetes or peripheral arterial disease

ACC/AHA 2007 Clinical Expert Consensus Document on Coronary Artery Calcium Scoring

Asymptomatic individuals with an intermediate risk may be reasonable candidates for CHD testing using CAC as a potential means of modifying risk prediction and altering therapy.

On the other hand, there is little to be gained by testing with CAC in patients with low risk.

Patients at high risk eg Diabetes should be treated aggressively anyway

New role for MSCT

Non-invasive coronary angiography

Dual imaging (calcium and lumen)
maybe major advance

64-slice cardiac images of a normal heart and coronary arteries

64-slice coronary CT (A) and conventional coronary angiogram (B) demonstrating a lesion (arrow) in the mid-right coronary artery.

Non-invasive MSCT for calcium score and angiography

3D reconstruction showing
Coronary irregularities in a Diabetic without calcification

64-slice coronary CT images of a normal coronary tree.

Patent grafts to the left anterior descending (LAD), left circumflex (LCx) and right coronary artery (RCA)

Lesion in the graft to the LAD and a patent graft to the diagonal branch. Invasive angiography confirm these findings.

Other novel ways of assessing risk

Carotid artery

Intimal medial thickness

Greater carotid intimal:medial thickness and risk of cardiovascular sequelae

Other novel risk factors:

Importance of inflammatory
markers

Inflammation markers and relative risk
