

What's new in cardiovascular medicine and lipid disorders

Select 74 Meeting, 11th January 2018, Bristol

Urs Widmer, Senior Medical Officer, SwissRe

Table of Contents / Agenda

1. Coronary Interventions: Burning questions
2. Unusual causes for AMI
3. CVD biomarkers
4. CVD risk factors: Lipidology
5. CVD risk factors: Glucocentric view
6. CVS risk assessment: Further developments?

- Does PCI improve survival in **SIHD**?
- **Left main** interventions by PCI?
- Revascularization in **STEMI**?
- Chronic total occlusions (**CTOs**)?
- **Bioresorbable Scaffolds** (BRS)?

1. Coronary Interventions

Despite 40 years of coronary balloon angioplasty:

Many unanswered questions remain

FFR and iFR in the Diagnosis and Treatment of Heart Disease

Implementing FFR and iFR into daily practice

Countless studies indicating the weakness of the angiogram, far too many operators still rely on it for treatment guidance elimination of unnecessary treatments and reduction in readmissions. Unfortunately, many interventional cardiologists are still making final decisions to stent a vessel based on angiographic results without taking into consideration physiologic parameters.

<https://www.dicardiology.com/article/ffr-and-ifr-diagnosis-and-treatment-heart-disease>

Fractional Flow Reserve–Guided Multivessel Angioplasty in Myocardial Infarction

MACCE denotes the composite of all-cause mortality, nonfatal myocardial infarction, any revascularization, and cerebrovascular events.

N Engl J Med 2017;376:1234-44.

Percutaneous coronary intervention in stable angina (ORBITA): a double-blind, randomised controlled trial

*Rasha Al-Lamee, David Thompson, Hakim-Moulay Dehbi, Sayan Sen, Kare Tang, John Davies, Thomas Keeble, Michael Mielewczik, Raffi Kaprielian, Iqbal S Malik, Sukhjinder S Nijjer, Ricardo Petraco, Christopher Cook, Yousif Ahmad, James Howard, Christopher Baker, Andrew Sharp, Robert Gerber, Suneel Talwar, Ravi Assomull, Jamil Mayet, Roland Wensel, David Collier, Matthew Shun-Shin, Simon A Thom, Justin E Davies, Darrel P Francis, on behalf of the ORBITA investigators**

ORBITA: World's first Sham-Controlled PCI Trial 2017 (from UK)

ORBITA remains, by far, one of the most controversial and heatedly debated studies in a long time.

CCS=Canadian Cardiovascular Society angina severity grading. CPET=cardiopulmonary exercise testing. DSE=dobutamine stress echocardiography. iFR=instantaneous wave-free ratio. FFR=fractional flow reserve. PCI=percutaneous coronary intervention.

Percutaneous coronary intervention in stable angina (ORBITA): a double-blind, randomised controlled trial

Coronary angiograms of the first 12 consecutively randomised patients
The target vessel is marked with an asterisk.

Percutaneous coronary intervention in stable angina (ORBITA): a double-blind, randomised controlled trial

	PCI	Placebo
Exercise time (s)		
Patients assessed	104	90
Pre-randomisation	528.0 (178.7)	490.0 (195.0)
Follow-up	556.3 (178.7)	501.8 (190.9)
Increment (pre-randomisation to follow-up)	28.4 (95% CI 11.6 to 45.1)	11.8 (95% CI -7.8 to 31.3)
Difference in increment between groups	16.6 (95% CI -8.9 to 42.0)	..
p value	0.200	

Does PCI Improve Survival in SIHD?

- **Average RCT** outcomes will not help very much.
- Trials, large enough to drill down to many subsets are needed.
- **New trials** of low ischemic risk should compare PCI with OMT.
- The ongoing **ISCHEMIA** trial is looking at higher risk patients with selection based on physiology (large ischemic burden on nuclear scan).
- Trials with selection based on anatomy (invasive angiography or CTA) are also needed.
- Sham-control RCTs should also be considered in the U.S.

Stable High-Sensitivity Cardiac Troponin T Levels and Outcomes in Patients With Chest Pain

Patients (N=22,589) >25 years of age with chest pain and hs-cTnT analyzed concurrently in the emergency department of Karolinska University Hospital, Stockholm, Sweden from 2011 to 2014

Andreas Roos, MD,^{a,b} Nadia Bandstein, MD, PhD,^{a,b} Magnus Lundbäck, MD, PhD,^{c,d} Ola Hammarsten, MD, PhD,^e Rickard Ljung, MD, PhD,^f Martin J. Holzmann, MD, PhD^{a,b}

High sensitivity cardiac troponin test results in the general population?

High-Sensitivity Cardiac Troponin Concentration and Risk of First-Ever Cardiovascular Outcomes in 154,052 Participants

Peter Willeit, MD, MPhil, PhD,^{a,b} Paul Welsh, PhD,^c Jonathan D.W. Evans, MBChB,^{b,d} Lena Tschiderer, Dipl-Ing, BSc,^a Charles Boachie, BSc,^c J. Wouter Jukema, MD, PhD,^e Ian Ford, PhD,^f Stella Trompet, PhD,^g David J. Stott, MD,^c Patricia M. Kearney, MD, PhD,^h Simon P. Mooijaart, MD, PhD,^g Stefan Kiechl, MD,^a Emanuele Di Angelantonio, MD, MSc, PhD,^{b,i,j,k} Naveed Sattar, MD, PhD^c

In the general population, high cardiac troponin concentration within the normal range is associated with increased CVD risk. This association is independent of conventional risk factors, strongest for fatal CVD, and applies to both CHD and stroke.

NT-proBNP as predictor of diffuse fibrosis in heart failure?

1,334 participants (52% white, 23% black, 11% Chinese, 14% Hispanic, and 52% men with a mean age of 67.6 years) at 6 sites had both serum NT-proBNP measurements and CMR with T1 mapping of indices of fibrosis at 1.5 T.

NT-proBNP as predictor of diffuse fibrosis in heart failure?

NT-proBNP and Myocardial Fibrosis

The Invisible Link Between Health and Disease*

Ana G. Almeida, MD, PhD

- Natriuretic peptides discovered in the 1980s
- Myocardial stretch signal is the key stimulant for BNP synthesis
- In the normal state, the cardiac production and plasma concentrations of BNP and NT-proBNP are very low but are readily increased with appropriate stimulus
- NT-proBNP and BNP are established as powerful biomarkers for heart failure diagnosis and prognosis, identifying high-risk patients
- Liu et al. examined the relationship of NT-proBNP and diffuse myocardial fibrosis in a community-based study from the MESA (Multi-Ethnic Study of Atherosclerosis) study, using a cardiac magnetic resonance T1 mapping technique (accepted as a surrogate marker of diffuse fibrosis)

4. CVD risk factors

Lipidology

FH Homozygote

Plasma Cholesterol

Total ~850 mg/dl

LDL ~783 mg/dl

Angina Age 3

Heart Attack Age 6

What causes Familial Hypercholesterolemia?

PCSK9 and PCSK9 Inhibitors

Gene of rare effect: A mutation that gives people rock-bottom cholesterol levels has led geneticists to what could be the next blockbuster heart drug.

Helen Hobbs and Jonathan Cohen's approach to heart-disease genetics yielded a target for drugs that could compete with statins, see **2016 Breakthrough Prize**

Stephen S. Hall, 152 | NATURE | VOL 496 | 11 APRIL 2013

Interpretation of the evidence for the efficacy and safety of statin therapy

Rory Collins, Christina Reith, Jonathan Emberson, Jane Armitage, Colin Baigent, Lisa Blackwell, Roger Blumenthal, John Danesh, George Davey Smith, David DeMets, Stephen Evans, Malcolm Law, Stephen MacMahon, Seth Martin, Bruce Neal, Neil Poulter, David Preiss, Paul Ridker, Ian Roberts, Anthony Rodgers, Peter Sandercock, Kenneth Schulz, Peter Sever, John Simes, Liam Smeeth, Nicholas Wald, Salim Yusuf, Richard Peto

Association of blood concentrations of total cholesterol with rates of coronary heart disease mortality.

Proportional major vascular event reductions versus absolute LDL cholesterol reductions in randomised trials of routine statin therapy versus no routine statin use and of more intensive versus less intensive regimens (CTT Collaboration)

Statin awareness and reported muscle-related adverse events

Adverse events associated with unblinded, but not with blinded, statin therapy in the Anglo-Scandinavian Cardiac Outcomes Trial—Lipid-Lowering Arm (ASCOT-LLA): a randomised double-blind placebo-controlled trial and its non-randomised non-blind extension phase

Ajay Gupta, David Thompson, Andrew Whitehouse, Tim Collier, Bjorn Dahlof, Neil Poulter, Rory Collins, Peter Sever, on behalf of the ASCOT Investigators

These analyses illustrate the so-called nocebo effect, with an excess rate of muscle-related AE reports only when patients and their doctors were aware that statin therapy was being used and not when its use was blinded.

These results will help assure both physicians and patients that most AEs associated with statins are not causally related to use of the drug and should help counter the adverse effect on public health of exaggerated claims about statin-related side-effects.

“Like cholera, obesity may be a problem that cannot be solved by individual persons but that requires community action”

6. CVD risk factors Glucocentric view

Primary care-led weight management for remission of type 2 diabetes (DiRECT): an open-label, cluster-randomised trial

Michael EJ Lean*, Wilma S Leslie, Alison C Barnes, Naomi Brosnahan, George Thom, Louise McCombie, Carl Peters, Sviatlana Zhyzhneuskaya, Ahmad Al-Mrabeh, Kieren G Hollingsworth, Angela M Rodrigues, Lucia Rehackova, Ashley J Adamson, Falko F Sniehotta, John C Mathers, Hazel M Ross, Yvonne McIlvenna, Renae Stefanetti, Michael Trenell, Paul Welsh, Sharon Kean, Ian Ford, Alex McConnachie, Naveed Sattar, Roy Taylor*

Remission of diabetes in relation to weight loss at 12 months

Open-label, cluster-randomised trial (DiRECT) at 49 primary care practices in Scotland and the Tyneside region of England.

20-65 years old individuals who had been diagnosed with type 2 diabetes within the past 6 years, with a BMI 27-45 kg/m², and not on insulin.

149 participants per group comprised the intention-to-treat population. At 12 months, almost half of participants achieved remission to a non-diabetic state and off antidiabetic drugs. Remission of type 2 diabetes is a practical target for primary care.

Professor **Roy Taylor** at Newcastle University (left) and Professor **Mike Lean** at the University of Glasgow (right) are leading the DiRECT study

Primary Prevention of Atherosclerosis

Time to Take a Selfie?*

Prevention of ASCVD: A future framework for prevention of atherosclerotic cardiovascular disease (ASCVD), potentially incorporating imaging, biomarkers, and genetics.

Predicting Cardiovascular Risk Factors from Retinal Fundus Photographs using Deep Learning

Ryan Poplin, Avinash V. Varadarajan, Katy Blumer, Yun Liu, Michael V. McConnell, Greg S. Corrado, Lily Peng, Dale R. Webster

Ryan Poplin, MS^{1*}
Avinash V. Varadarajan, MS^{1*}
Katy Blumer, BS¹
Yun Liu, PhD¹
Michael V. McConnell, MD, MSEE²
Greg S. Corrado, PhD¹
Lily Peng, MD, PhD^{1**}
Dale R. Webster, PhD^{1**}

Deep learning was used to discover CVD risk factors from retinal fundus images. Using models trained on data from **284'335** patients, and validated on two independent datasets of **12'026** and **999** patients, we predict cardiovascular risk factors not previously thought to be present or quantifiable in retinal images, such as age, gender, smoking status, HbA1c, systolic blood pressure as well as major adverse cardiac events. Surprisingly, models used distinct aspects of the anatomy to generate predictions, such as optic disc or blood vessels.

Conclusion

- Fractional flow reserve (FFR)-guided PCI is best practice
- PCI + drug eluting stents (DES) are used, current bioresorbable scaffolds are to “clumsy” and have high rates of stent thrombosis
- ORBITA: UK pioneered the world’s first sham-controlled PCI Trial 2017 in stable, 1-vessel CAD
- hs-Troponin and NT-proBNP might become useful for long term prognosis
- Drugs targeting PCSK9 (via degradation of the LDL receptor) lower cholesterol effectively, but are expensive
- Screening by imaging for detecting subclinical atherosclerosis even in the absence of CVD risk factors might be used more often: “Time for a selfie”
- Type 2 Diabetes therapy paradigm change: T2D gets in remission after ± 15 kg weight loss. Diets should be prescribed, not antidiabetic drugs! (Fasting mimicking diet, Low carbohydrate & high fat diet, low calorie diet)

Thank you!
